NOTES FOR HEALTHCARE PROFESSIONALS

This short patient questionnaire has been created for use prior to dental appointments to aid sharing of patient information in order to support behaviour change.

The final three questions on the assessment are designed to help you understand a patient's level of commitment to behaviour change. These techniques form part of **motivational interviewing (MI)**, a patient-centred but directive technique that aims to help people to change their behaviour.¹

Question 6 uses an 'importance ruler' which can be used to understand the patient's assessment of their own goal. The overall score is not of interest but rather the way it can be used to support change.

- If a patient gives a high score e.g. 9, follow up with a comment on how high this is and establish that the behaviour change is something that must be very important to them. This will then lead to the patient agreeing that the action is important
- If a patient gives a low score e.g. 3, follow up with the question 'why not 2 (x-1)'?

 This is generally counterintuitive to what most clinicians would say to someone who rated the importance of an oral care behaviour low. By focusing on the lower end of the scale patients become aware that although they rate the behaviour as not terribly important, they are not totally disinterested. The conversation can then move to explore why they are at all interested.

Question 7 is designed to facilitate discussion around the patient's belief and confidence that they can achieve a task. It uses a confidence ruler and the aim is to enhance the patient's confidence that he/she can succeed by using previous behaviour examples.¹

Scores are discussed in a similar way to the importance ruler – if a low score is selected ask the patient why they did not choose a lower figure as a way to reinforce the presence of confidence.
