# WHY USE AN ADHESIVE?

Over time your mouth may physically change and lead to issues like ridge resorption which may make it difficult to hold your denture in place. Conditions such as dry mouth can also mean you may struggle due to a lack of saliva. An adhesive can help in a number of ways, even with well-fitting dentures.

## 1 Help increase denture hold

Denture adhesives can enhance the fit of well-fitting dentures to help hold them securely in place. This increased sense of hold & reduced movement can help you to eat, speak and smile with confidence.

## 2 Help minimize trapped food

Even well-fitting dentures are susceptible to food particles that can migrate under the denture and cause discomfort. Denture adhesives can seal out more food particles compared to no adhesive so you can savor every bite.

## 3 Help improve comfort

Denture adhesives help improve denture fit and comfort and help cushion gums. They help prevent gum irritation by keeping out food particles when used consistently as part of an effective denture care routine.

# WHY USE A CLEANSER?

## 1 Clean without scratching

Using a toothbrush, toothpaste, mouthwash or soap could damage your dentures and cause scratches. Scratches on the surface of your denture could enable bacteria build up. When used as directed, a cleanser cleans without scratching and removes stains in a more gentle way than brushing with regular toothpaste.

## 2 Effectively remove plaque

Plaque build-up on your denture could lead to gum irritation and even increased risk of tooth decay. A clean denture helps promote a healthy mouth and helps prevent further tooth loss.

## 3 Leaves dentures clean and fresh

Bacteria on your denture could lead to bad breath. Specialist denture cleansers are designed to kill odor-causing bacteria and leave dentures clean and fresh.
